PAN ALL PULSE BULLETIN #11 – JULY 7, 2006

Downy Mildew – The symptoms usually first appear on the lower surface of leaves, in patches, but it can also infect the stems of field peas. The fluffy greyish (or mousy coloured) growth is quite thick and "furry" compared to powdery mildew.

- Devin Pendree with Webbs Crop Service in Vermillion reports "I am finding Downy Mildew in quite a few fields that I have been scouting lately. I do not perceive it to be a major threat, especially considering the weather we have been experiencing. However, it is fairly wide spread and this is the 2nd year that I have noticed it throughout the area."
